

$$\left(\|k\|^2 - \sum_{i,j=1}^m |\alpha_{ij}|^2 \right) \|f\|^2 \left\| K - \sum_{i,j=1}^m \alpha_{ij} E_{ij} \right\|^2 \leq \|k\|^2 - \sum_{i,j=1}^m |\alpha_{ij}|^2 \rightarrow 0.$$

所以 K 是紧算子.

11. 易见 $F: x(t) \mapsto f(t)x(t)$ 是 $L^2(\Omega)$ 上对称算子, 若 F 还是紧算子, 证明 $\sigma(F) = \{0\}$, 从而有 $F = 0$.

12. 利用第 4 题的结果.

16. 因为 $A \in \mathcal{C}(H)$, $A = A^*$, 故有 $\sigma(A) \setminus \{0\} = \sigma_p(A) \setminus \{0\} \subset \mathbb{R}$. $\forall \lambda \in \sigma_p(A)$, $\exists x_\lambda$, 使得 $Ax_\lambda = \lambda x_\lambda$, $\|x_\lambda\| = 1$. 由 $(Ax_\lambda, x_\lambda) = \lambda$ 即可得 $m = m(A) \leq \lambda \leq M(A) = M$.

设 $M > m \geq 0$, 则有 $\|A\| = M$. 事实上, 显然有 $M \leq \|A\|$, 兹证相反的不等式. $\forall \lambda > 0$, 有

$$\begin{aligned} \|Ax\|^2 &= \frac{1}{4} \left[\left(A \left(\lambda x + \frac{1}{\lambda} Ax \right), \lambda x + \frac{1}{\lambda} Ax \right) - \left(A \left(\lambda x - \frac{1}{\lambda} Ax \right), \lambda x - \frac{1}{\lambda} Ax \right) \right] \\ &\leq \frac{1}{4} M \left(\left\| \lambda x + \frac{1}{\lambda} Ax \right\|^2 + \left\| \lambda x - \frac{1}{\lambda} Ax \right\|^2 \right) \\ &= \frac{1}{2} \left(\lambda^2 \|x\|^2 + \frac{1}{\lambda^2} \|Ax\|^2 \right). \end{aligned}$$

取 $\lambda = (\|Ax\|/\|x\|)^{1/2}$, 则有

$$\|Ax\|^2 \leq \frac{1}{2} M \left(\frac{\|Ax\|}{\|x\|} \|x\|^2 + \frac{\|x\|}{\|Ax\|} \|Ax\|^2 \right) = M \|x\| \|Ax\|,$$

由此得 $\|Ax\| \leq M \|x\|$. 所以 $\|A\| \leq M$. 因此 $\|A\| = M$. 由 M 的定义, $\exists x_n$, 使得 $\|x_n\| = 1$, $(Ax_n, x_n) \rightarrow M$. 于是

$$\begin{aligned} 0 &\leq \|Ax_n - Mx_n\|^2 = \|Ax_n\|^2 - 2M(Ax_n, x_n) + M^2\|x_n\|^2 \\ &\leq \|A\|^2 - 2M(Ax_n, x_n) + M^2 \rightarrow 0. \end{aligned}$$

从而有 $\lim_{n \rightarrow \infty} (Ax_n - Mx_n) = 0$. 又 A 是紧算子, $\{Ax_n\}$ 必有收敛子序列 $\{Ax_{n_k}\}$, 此时 $\{x_{n_k}\}$ 也收敛. 记 $x_{n_k} \rightarrow x_0$, 则 $\|x_0\| = 1$, $Ax_{n_k} \rightarrow Ax_0 = Mx_0$, 所以 $M \in \sigma_p(A)$.
